Model building

#### Lie groups

$$U = \exp\left(i\sum_{j} T_{j}\theta^{j}\right),\tag{1}$$

where  $\theta^{j}$  are the parameters of the transformation and  $T_{i}$  are the generators.

## SO(1)

Consider the  $1 \times 1$ 

$$K = -i, (2)$$

which generates an element of dilaton group , SO(1),  $R(\xi)$ 

$$\lambda(\xi) = e^{\xi}, \tag{3}$$

which are just the group of the real exponentials. Such a number can be transformed as

$$x \to x' = e^{\xi} x, \tag{4}$$

that corresponds to a boost by  $e^{\xi}$ . We can defin the invariant scalar product just as the division of real numbers, such that

$$x \cdot y \to x' \cdot y' \equiv \frac{x'}{y'} = \frac{e^{\xi} x}{e^{\xi} y} = \frac{x}{y} = x \cdot y. \tag{5}$$

#### SO(1,1)

Queremos obtener una representación  $2 \times 2$  del álgebra

$$K = \begin{pmatrix} 0 & -i \\ -i & 0 \end{pmatrix} \to K^2 = -\mathbf{1} \,, \tag{6}$$

que genera un elemento del grupo  $\mathsf{SO}(1,1)$  con parámetro  $\xi$ 

$$\Lambda = \exp(i\xi K) = \begin{pmatrix} \cosh \xi & \sinh \xi \\ \sinh \xi & \cosh \xi \end{pmatrix}, \qquad (7)$$

La transformación de una coordenada temporaloide y otra espacialoide (c=1)

$$\begin{pmatrix} t \\ x \end{pmatrix} = \begin{pmatrix} x^0 \\ x^1 \end{pmatrix} \to \begin{pmatrix} x'^0 \\ x'^1 \end{pmatrix} \begin{pmatrix} \cosh \xi & \sinh \xi \\ \sinh \xi & \cosh \xi \end{pmatrix} \begin{pmatrix} x^0 \\ x^1 \end{pmatrix}$$

$$\cosh \xi = \gamma = \frac{1}{\sqrt{1 - v^2}}$$

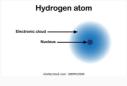

**Special**: parameter  $\xi$  or v is constant, e.g, inertial system invariance: *Global* conservation of E and p (still action at a distance!)

**General**: parameter  $\xi(t, \mathbf{x})$  or  $v(t, \mathbf{x})$  is constant, e.g, accelerated system invariance: **Local** conservation of E and  $\mathbf{p}$ 

Noether's paradigm

## U(1): From special $\theta$ to general $\theta(t, x)$

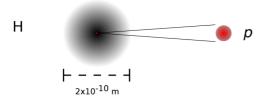

What is a particle wavicle? https://www.quantamagazine.org/what-is-a-particle-20201112/

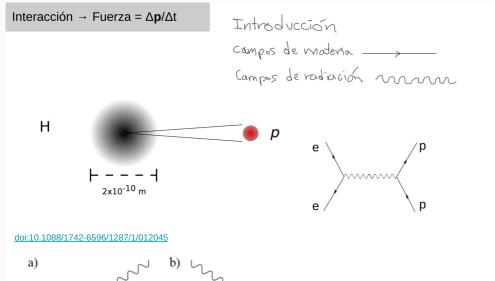

#### Is a "Quantum Excitation of a Field"

#### Is a "Irreducible Representation of a Group"

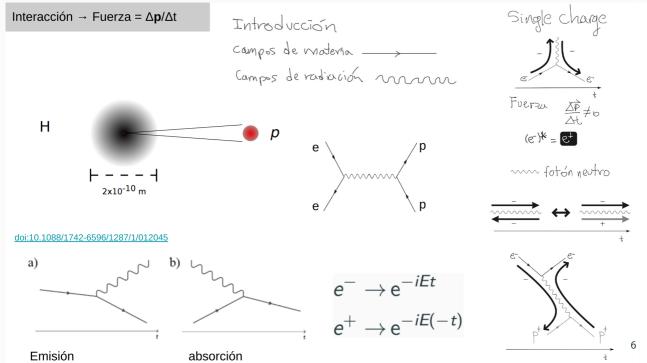

absorción

Emisión

Under a general Lorentz transformation we have.

$$A^{\mu}(x) \to A'^{\mu}(x) = \Lambda^{\mu}{}_{\nu}A^{\nu}(\Lambda^{-1}x).$$
 (8)

A pure underscript 4-vector is

$$\partial_{\mu} = \frac{\partial}{\partial x^{\mu}} = \left(\frac{\partial}{\partial t}, \frac{\partial}{\partial x}, \frac{\partial}{\partial y}, \frac{\partial}{\partial z}\right) = (\partial_{0}, \nabla). \tag{9}$$

From

$$\frac{1}{x'^{\mu}} = \left(\Lambda^{-1}\right)^{\nu}_{\mu} \frac{1}{x^{\nu}} \,, \tag{10}$$

the tranformation properties for a  $\partial_{\mu}=\partial/\partial x^{\mu}$ , are

$$\partial_{\mu}^{\prime} = \left(\Lambda^{-1}\right)^{\nu}_{\mu} \partial_{\nu} \,. \tag{11}$$

In this way, the invariant scalar product between the 4-vector field and the four-gradient is just

$$\partial_{\mu}A^{\mu} \to \partial'_{\mu}A'^{\mu} = \partial_{\mu}A^{\mu} \,. \tag{12}$$
