Evidences for Dark Matter

Several observations indicate the existence of non-luminous Dark Matter (*missing gravitational force*) at very different scales!

- * Galactic rotation curves
- * RC in Clusters of galaxies
- * Clusters of galaxies

From Nicolas Bernal at NEMO-C (Medellín 2024)

Cosmic Microwave Background temperature: $T = 2.726 \text{ K}$ with $\Delta T/T \sim 10^{-6}$

$$\mathcal{L}_5 = \frac{h}{\Lambda} (\nu_R)^\dagger L \cdot HS^* + \text{H.c.},$$

FIG. 6. T3-1-A-I ($\alpha = 0$): $B - L$ flux in the Dirac radiative seesaw.

T3-1-A-I	$(\nu_{Ri})^\dagger$	$(\nu_{Rj})^\dagger$	$(\nu_{Rk})^\dagger$	$(\psi_R)^\dagger$	ψ_L	η_a	σ_a	S
L	$+4$	$+4$	-5	r	$-r$	$1-r$	$4-r$	3

From $Z_2 \times U(1)$ to a (secluded) $U(1)$ gauge symmetry with chiral fermions

In a fundamental theory the elementary fermions are expected to be chiral, i.e., their charges should not allow a mass term larger than the scale of spontaneous symmetry breaking. For any set of charges associated to a $U(1)$ gauge symmetry

$$\mathbf{Z} = [Z_1, Z_2, \dots, Z_N] ,$$

The triangle anomaly with three $U(1)$ gauge bosons on the external lines, i.e., the $[U(1)]^3$ anomaly, and with one $U(1)$ gauge boson and two gravitons on the external lines should also be cancelled

$$\sum_{\alpha=1}^N Z_{\alpha} = 0, \qquad \sum_{\alpha=1}^N Z_{\alpha}^3 = 0, \qquad (1)$$

$U(1)_Y$: no vector-like, i.e., pairs of fields with ‘equal-but-opposite’ charges

The hypercharge for one generation in the standard model can be seen as gauge Abelian symmetry $U(1)_Y$ with 15 left-handed Weyl massless fermions with integer charges

$$Y = [1, 1, 1, 1, 1, 1, -4, -4, -4, 2, 2, 2, -3, -3, 6]$$

which satisfy

$$\sum_i Y_i = 0, \quad \sum_i Y_i^3 = 0.$$

If we introduce an scalar, H , of charge 3 we can form Yukawa couplings through the Dirac pairs

$$u_\alpha = (1, -4), (1, -4), (1, -4), \quad d_\alpha = (1, 2), (1, 2), (1, 2), \quad e = (-3, 6)$$

and the *chiral fermions* acquire Dirac masses after the EWSB. They are degenerate because the additional color symmetry. One remains massless, $\nu_L = (-3)$. The remnant Z_3 symmetry guarantees the stability of the lightest quark

Secluded gauge $U(1)_D$ without vector-like fermions:

$$\mathbf{S} = [\chi_1, \chi_2, \dots, \psi_1, \psi_2, \dots, \psi_{N'}]$$

- *Dark Higgs mechanism*: Singlet dark Higgs ϕ acquires a vev and give mass to the dark photon

$$\mathcal{L} = i\psi_a^\dagger \overline{\sigma}^\mu (\partial_\mu - ig_D Z'_\mu) \psi_a - \frac{1}{4} V_{\mu\nu} V^{\mu\nu} + \sum_{a < b} h_{ab} \psi_a \psi_b \phi^{(*)} + \text{h.c.} - V(\phi). \quad (2)$$

- S_α are the charges of SM-singlet right-handed chiral fermions with $N \geq 5$
 - χ_i *massless fermions* with $i = 1, \dots, N'$ with $N' \leq N$
 - ψ_a *multi-component dark matter*: massive after the spontaneous symmetry breaking of $U(1)_D$ with $a = N' + 1, \dots, N$
- *Larger parameter space*: Dark photon, Z' , exclusions instead of $B - L$ -like Z'
- Z' and ϕ masses are related by (arXiv:1610.03063)

$$h/g_D = \sqrt{2} m_\psi / m_{Z'}.$$

Multi-component and two-mediator DM with kinetic mixing

Two-mediator: Dark photon and dark Higgs

$$\begin{pmatrix} h_1 \\ h_2 \end{pmatrix} = \begin{pmatrix} \cos \alpha & -\sin \alpha \\ \sin \alpha & \cos \alpha \end{pmatrix} \begin{pmatrix} \text{Re}(H^0) \\ \text{Re}(S) \end{pmatrix}$$

$$\mathcal{L}_{B'} \supset -\frac{\epsilon}{2} B'_{\mu\nu} B^{\mu\nu}$$

After the diagonalization of the kinetic terms

$$\mathcal{L}_{\text{mix}} \supset Z'_\mu (\epsilon e J_{EM}^\mu + g_D J_D^\mu)$$

Scotogenic models, which explain dark matter and neutrino masses and mixings, have diverse realizations with a wide range of predictions through various portals and messengers.

When applied to chiral dark matter models arising from Abelian gauge symmetries, the stability of dark matter is automatically ensured, giving rise to a rich secluded dark sector.

Thanks!
